Comments:

Good job! Your final product is impressive, but it is still unattractive. The searching doesn't work for longer UPC numbers. Likewise, your filters work for the Inventory when they should probably be for the History. Your Excel generation is for the Inventory and should almost certainly be for the History. The column names should follow the same uppercase/lowercase formatting. For the Inventory, it shouldn't show the donor or the date, since different donors could have donated the same item on different dates. The total price for the Inventory is also wrong.

Your demo was fine, but there was too much small text on some of your PowerPoint slides.

Your manual was relatively thorough, but it was for a version of the software with a different appearance, which will likely be confusing to a user.

I'd like to see a little more thoroughness with your testing. Your product allows negative numbers for UPCs. It doesn't allow badly formatted dates, but it doesn't give an error message either.

Your client was very pleased. Jaymi Green said, "They did everything we asked of them and were more than willing to make adjustments when asked. The program also actually works and is easier to navigate than I expected."

In terms of style, there are issues with your code. You have static member variables everywhere. You have very few comments. You have a lot of debug output showing up on the console. You have different styles of brace placement.
